

Happy Cake Website Project Report

Assignment 1

Project Name: Happy Cake Bakery Website

Student: Gauhar Mukhametbay

1. Project Description

The Happy Cake website is a bakery website created using HTML5. The purpose of this project is to create a simple and informative website for a bakery business where users can view available cakes, prices, contact information and ordering options.

The website represents a bakery that provides different desserts for birthdays, celebrations and special occasions. Customers can explore the menu page, learn more about available products, contact the bakery and submit an order request through the contact form.

The project was developed without CSS or JavaScript because the assignment required only HTML structure. The main focus of the project was creating a clear webpage structure using HTML5 semantic elements, tables, forms, images and links.

The website contains four pages:

- Home page
- Menu page
- Contact page
- Colophon page

2. Website Structure

The Happy Cake website consists of four HTML pages.

index.html - Home Page

The homepage introduces the Happy Cake bakery. It contains information about the bakery, its values and special moments. The page also includes real photographs of bakery products.

menu.html - Menu Page

The menu page presents available cakes with descriptions and prices. A HTML table was used to organize cake information clearly. The page also contains product images.

contact.html - Contact Page

The contact page provides bakery information such as address, phone number and email. It also includes an order form where customers can enter their information and select cake options.

colophon.html -Colophon Page

The colophon page explains how the website was created, what technologies were used and provides information about the development process.

3. HTML Elements Used

The website was created using HTML5 elements.

The main HTML elements used include:

- `<html>` - defines the HTML document.
- `<head>` - contains metadata information.
- `<body>` - contains visible webpage content.
- `<header>` - contains the website title and navigation.
- `<nav>` - provides links between pages.
- `<main>` - contains the main content of each page.
- `<section>` - separates different content areas.
- `<article>` - contains independent information about the bakery.
- `<aside>` - provides additional information.
- `<figure>` and `<figcaption>` - organize images with descriptions.
- `<footer>` - contains copyright information.
- `<table>` - displays cake prices and descriptions.
- `<form>` - creates the cake order form.

Additional HTML elements were used, including headings, lists, links, images, input fields, textarea and select elements.

4. Task A -Anatomy of a Real Website

Analysis of a Similar Website

Before creating the Happy Cake website, a similar bakery website was analysed to understand common website structures and design organization.

The analysed website included common bakery features such as:

- navigation menu;
- product information;
- contact details;
- images of products;
- ordering information.

HTML Document Structure Analysis

The analysed website uses HTML5 document structure.

The main document features include:

DOCTYPE

The document starts with:

```
<!DOCTYPE html>
```

This tells the browser that the page uses HTML5.

Language

The language is defined using:

```
<html lang="en">
```

Charset

The charset declaration:

```
<meta charset="UTF-8">
```

defines character encoding.

Viewport

The viewport meta tag helps pages display correctly on different devices.

Title

The title element defines the name shown in the browser tab.

Meta tags

The website uses metadata such as:

- description;
- author;
- viewport.

Semantic Structure

Semantic HTML tags describe the meaning of content.

In my Happy Cake website I used:

- `header` for the website introduction;
- `nav` for navigation links;
- `main` for the main webpage content;
- `section` for grouping related information;
- `article` for bakery information;
- `footer` for copyright information.

Semantic tags were used instead of unnecessary `div` elements because they provide clearer structure and improve readability.

Structural Mistakes Found and Solutions

1. Poor content organization

Problem:

Some websites place different types of information together without clear separation.

Solution:

I used semantic sections to separate bakery information, menu content and contact details.

2. Missing alternative text for images

Problem:

Images without descriptions are difficult for accessibility tools to understand.

Solution:

I added meaningful `alt` attributes to all images.

3. Incorrect page navigation

Problem:

Users may have difficulty moving between pages.

Solution:

I created a navigation menu using the `nav` element and an unordered list with links to every page.

Hand-drawn Website Structure Sketch

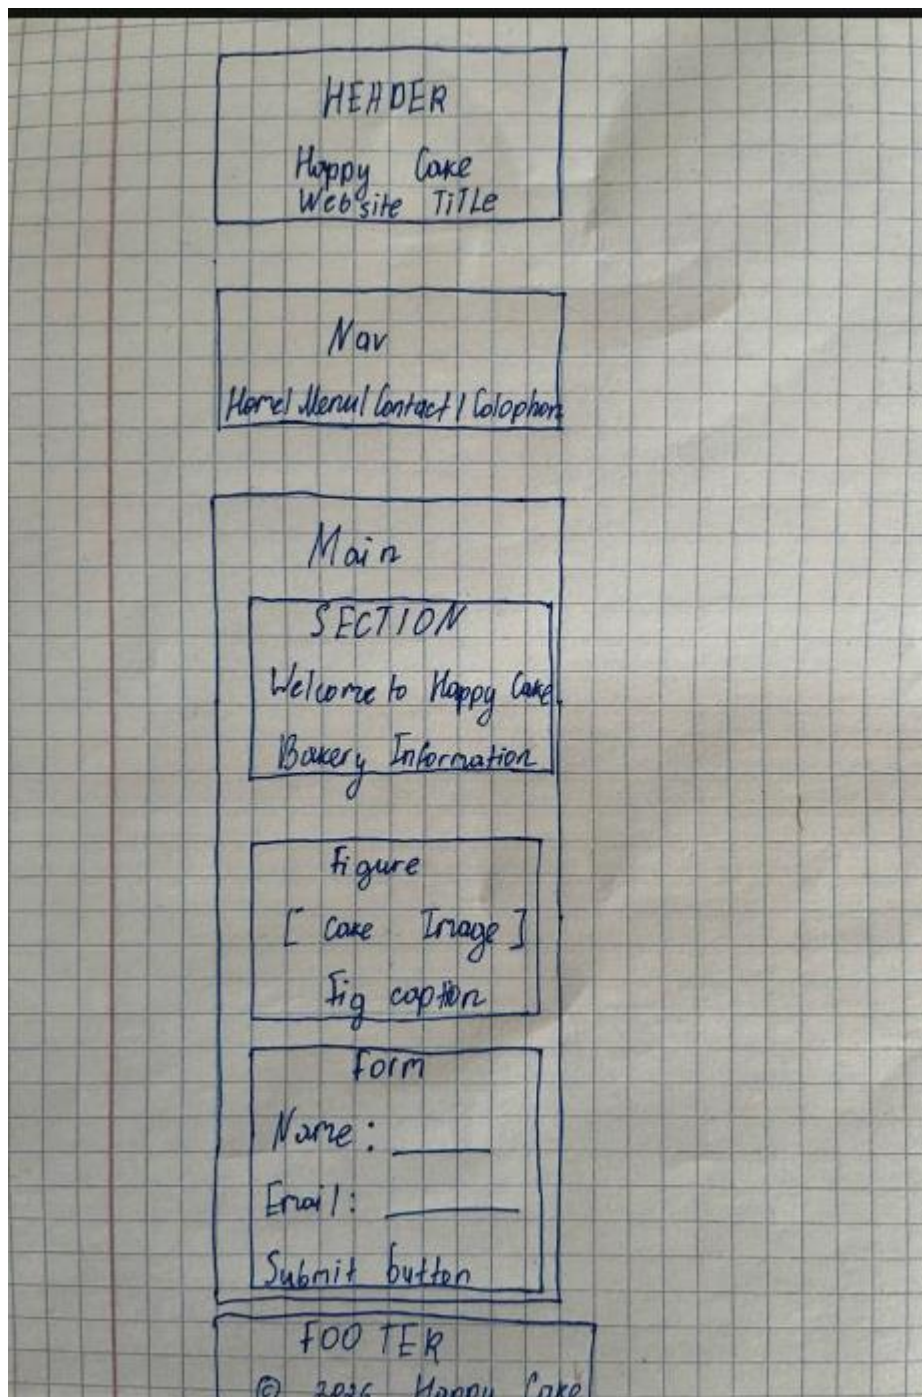

Figure 1. Hand-drawn structure of the webpage

5. Task B - How a Web Page Works

A web page is a document created using HTML elements that describe the structure and content of a website. HTML defines headings, paragraphs, images, tables, links and forms that are displayed in a browser.

When a user opens an HTML file, the browser reads the document from top to bottom. The browser identifies HTML tags and converts them into visible elements on the screen. The head section provides information about the document, while the body section contains the content users see.

In the Happy Cake website, semantic elements were chosen instead of using only div elements. For example, the `header` element was used to contain the website name and navigation area. The `section` element was used to organize different parts of the homepage and menu page. The `footer` element was used for copyright information.

The contact page contains an order form. When a visitor presses the Submit button, the browser collects the entered information according to the form settings. However, the form does not send data anywhere because there is no server-side processing implemented yet.

6. Images and Content

The website includes three real photographs taken by the student. The images represent bakery products and are used to make the website content more realistic.

The website content includes:

- cake descriptions;
- prices;
- bakery information;
- ordering instructions;
- contact details.

Real photograph of a custom decorated milk cake

7. HTML Validation

All HTML pages were tested using the W3C Nu HTML Checker.

The following files were validated:

- index.html
- menu.html
- contact.html
- colophon.html

The validation results showed:

No errors or warnings were found.

Welcome to Happy Cake

Happy Cake is a bakery that offers fresh cakes and desserts for different celebrations and everyday moments. The bakery provides customers with a variety of sweet products made with attention to quality and design. Customers can choose different cakes such as Medovik, Napoleon, Red Velvet and Cheesecake. Each dessert is prepared carefully to create a pleasant experience for visitors.

About Our Bakery

Happy Cake creates desserts for birthdays, family events and special occasions. The bakery focuses on beautiful decoration, delicious taste and customer satisfaction.

The main goal of the bakery is to make every celebration more memorable with a carefully prepared cake. *Fresh ingredients and creative designs* are important parts of the bakery's work.

Why Choose Happy Cake?

- Freshly prepared desserts
- Different cake choices for celebrations
- Simple ordering process
- Beautiful cakes for special moments

Our Special Moments

Happy Cake creates desserts for different occasions such as birthdays, family celebrations and special events. Customers can order cakes with different designs and decorations.

The bakery combines traditional recipes with creative ideas to make each dessert unique and memorable.

Website Development Information

Happy Cake website was created as an HTML project to present a small bakery business. The website contains information about cakes, prices, contact details and ordering options. The main goal was to create a simple HTML structure without using CSS styling.

The website provides users with clear information about bakery products and services. Each page was organized with headings, paragraphs, images, tables and forms to improve readability.

Technologies Used

The website was created using the following technologies:

- HTML5
- Visual Studio Code

HTML5 semantic tags were used to create the structure of the website, including header, main, section, figure and footer elements.

HTML Example

An example of a heading element is:

```
<h1>Happy Cake</h1>
```

This element creates the main heading displayed on a webpage.

Keyboard Instructions

To open the website in a browser, press Ctrl + O and select the required HTML file. Users can navigate between pages by clicking the links in the navigation menu.

Keyboard Instructions

To open the website in a browser, press Ctrl + O and select the required HTML file. Users can navigate between pages by clicking the links in the navigation menu.

Testing Output

HTML validation was completed successfully. All pages were checked in the browser and the website loaded without errors. The links, images, tables and forms were tested to make sure they work correctly.

Accessibility and Validation

The Happy Cake website was created with attention to accessibility and clear page structure. Semantic HTML elements such as header, main, section and footer were used to organize the content. The website was tested in a browser to make sure that all pages open correctly and navigation links work properly.

The project demonstrates basic HTML skills including creating forms, tables, images, links and structured text. The aim of this website is to provide users with simple information about the bakery and its services.

Development Notes

During development, AI assistance was used for generating ideas, checking HTML structure and improving text content. All final decisions about website organization and content were completed by the student.

10. AI Usage Log

During the development process, AI assistance was used for learning HTML concepts, checking webpage structure and understanding assignment requirements.

AI was used for:

- explaining HTML semantic elements;
- suggesting website structure;
- checking HTML organization;
- improving understanding of requirements.

All final website decisions, content selection and project organization were completed by the student.

11. Conclusion

The Happy Cake website was successfully created using HTML5. The project demonstrates the use of webpage structure, semantic HTML elements, tables, images and forms.

The website provides users with information about bakery products, prices, contact details and ordering options. The project helped develop practical skills in creating structured HTML documents and understanding how websites are organized.
